Topic: The Athens meeting concluded that the most important future ventures to mitigate the REE criticality include: (1) securing alternative RE supply chains and (2) identify new materials for high-speed machinery, processing and topologies that reduce demand for REEs. This RTG addresses the latter. This RTG aims at identifying novel

Topic: • Undertake the performance, integration and maturity assessments of Active Flow Control (AFC) for the take-off, landing and maneuver mission phases. To maximise the best application of the available resources applied to these studies a single air-vehicle platform (the Lockheed-Martin ICE configuration) will be the focus of this study.

• Improved understanding of transonic performance of AFC: Undertake studies to better validate transonic performance data for flow control devices.

- **Transient response of AFC:** Reviews of existing data will be undertaken and preliminary new aerodynamic studies (experimental and numerical) will be defined to assess/understand the transient behavior of flow control effectors (such as Circulation Control, Apex Blowing and Fluidic Thrust Vectoring).
- **Explore AFC applied at the conceptual design stage:** The objective will be “Design of the aircraft with AFC in mind” compared to the retrofit of AFC to a design based on use of conventional controls.
- **System integration studies:** The aim is to identify approaches to improve and validate the semi-empirical system models.

ANNEX 1
AC/340-N(2020)0023

Topic: (1) The efficient creation of S&C data sets based on highly accurate numerical CFD methods is of great interest. Various Reduced Order Models (ROMs) developed from these data need to be evaluated in their capability to accomplish this task, e.g. (a) Indicial response functions, (b) single-/multi fidelity surrogate models, (c) Proper Orthogonal Decomposition (POD) and/or Isomap-based ROMs, (d) neural networks. (2) Comparison of these models with established linear and/or nonlinear system identification models. (3) Assessment of reasonable training signals for aforementioned methods. (4) Data fusion of numerical and experimental data sources to enhance ROMs. (5) Application of potential beneficial models during control system design

STO.1278 (New)	AVT-352 - RTG - Measurement, Modeling and Prediction of Hypersonic Turbulence	Proposed by: STO AOC: DRT
-----------------------	--	--------------------------------------

Topic: The RTG Team would focus on turbulence modelling at high speeds. One of the objectives is to enhance the fundamental knowledge of near-wall hypersonic turbulence to inform both Large-Eddy Simulation (LES) and Reynolds-Averaged Navier-Stokes

(RANS) modelling of hydrodynamic and thermal Reynolds stresses under different pressure gradient regimes (e.g. favorable, adverse and zero) expected to be relevant to hypersonic flight. As the research progresses, the proposed AVT Task would analyze the effects of complex geometries on high speed turbulence, such as the one generated in the case of multimode transition. Another goal of the proposed Task is high altitude flight focusing on real-gas effects and chemical reactions in fully turbulent conditions, enabling the prediction of oxidation rates of thermal protection shields, such as carbon/carbon ceramics, and their survivability. As such, it is at the crossroads between aerodynamics and materials sciences.

For the success of the proposed task, these two efforts should be assisted by experimental diagnostics for turbulence to be performed at the existing ground facilities located at different NATO nations.

Topic: The contributions are expected in the following areas:

At the system level:

- **Distributed intelligent Control Systems**
- **Fault tolerance concepts and robust control**
- **Flight safety and cybersecurity strategies**
 - **Modular architectures**
 - **Certification considerations**
- **EMI-tolerant engine control networks, Fiber-Optic Engine Control Networks, Fly by Light Systems**
 - **High temperature-compatible communication architectures**
- **Standardized methodologies for component evaluation, integration and testing**
 - **Robust, reliable diagnostic and prognostic systems**

At the component level :

- **Standardized smart sensors and actuators**
- **Standardized system infrastructure – software, power supplies, chips, communication hardware**
 - **Use and transition of test cell proven advanced measurement techniques**
 - **Fiber-optic sensing**
 - **Certifiable components**
